This book
traces the

development of the basic concepts in cardiovascular physiology in the light of the accumulated experimental and clinical evidence and, rather than making the findings fit the standard pressure-propulsion mold, let the phenomena 'speak for themselves'. It starts by considering the early embryonic circulation, where blood passes through the valveless tube heart at a rate that surpasses the

contractions of its walls, suggesting that the blood is not propelled by the heart, but possesses its own motive force, tightly coupled to the metabolic demands of the tissues. Rather than being an organ of propulsion, the heart, on the contrary, serves as a damming-up organ, generating pressure by rhythmically impeding the flow of blood. The validity of this model is then confirmed by

comparing the key developmental stages of the cardiovascular system in the invertebrates, the insects and across the vertebrate taxa. The salient morphological and histological features of the myocardium are reviewed with particular reference to the vortex. The complex, energy-dissipating intracardiac flow-patterns likewise suggest that the heart functions as an organ of impedance,

whose energy consumption closely matches the generated pressure, but not its throughput. Attention is then turned to the regulation of cardiac output and to the arguments advanced by proponents of the 'left ventricular' and of the 'venous return' models of circulation. Hyperdynamic states occurring in arteriovenous fistulas and congenital heart defects, where communication exists

between the systemic and pulmonary circuits at the level of atria or the ventricles, demonstrate that, once the heart is unable to impede the flow of blood, reactive changes occur in the pulmonary and systemic circulations, leading to pulmonary hypertension and Eisenmenger syndrome. Finally, the key points of the book are summarized in the context of blood as a 'liquid organ'

with autonomous movement. *Timeline Science and Technology* Courier Dover Publications This book provides truly new insights into the seemingly elusive concept of luxury and it does so using a compact and convenient format. More precisely, it condenses the authors' groundbreaking book on *Luxury: Marketing & Management* - which has become a standard

<p>textbook on luxury and is used in Universities around the world - into easy to digest pieces of knowledge, yet maintains the essence of the full-fledged original. Thus, the Essentials provide the best format for people on the go yet provide a comprehensive entry into this fascinating world of luxury with its most unique products, ideas and challenges for consumers, managers and</p>	<p>also scientists. Daniel A. Langer & Oliver P. Heil on why they wrote this book: "Whether we teach luxury to students or have discussions with luxury professionals or talk to luxury consumers, one common theme emerges again and again: While luxury seems to be easy to grasp at first, it quickly evolves into a most complicated endeavor. That is, its management</p>	<p>poses most unique challenges, e.g. as price is often seemingly irrelevant. While intuitively there should be a lot of publications on luxury that really matter, there are only a few that try to meet the luxury challenge." "Luxury Essentials" has the ambition to provide what many call the "gold standard" in luxury publications "Luxury: Marketing & Management"</p>

to a much broader audience. It covers the key content in an essential, more compact, easy to digest format. To those who want to go beyond the essentials and get additional inspiration by more background and more examples, the original textbook would seem to be a natural next step to read. This is what the world's leading experts on luxury say about the

authors' book "Luxury: Marketing & Management" "The book Luxury: Marketing & Management will be of considerable interest to both managers and academics seeking to understand and manage luxury goods in the 21st Century." Prof. Dr. David B. Montgomery, Stanford University & former Dean, Singapore Management University "This new and interesting research provides

insight into the unique world of luxury and I have no doubt will prove a fascinating read for consumers and managers. Rolls-Royce Motor Cars has been at the pinnacle of automotive luxury for over 100 years and it is enlightening to see scientific research on the industry." Torsten Muller-Otvos, CEO Rolls-Royce Motor Cars Ltd "This book provides a large coverage of

research on luxury, combined with new practical approaches, such how to analyze the luxury potential of a category on the basis of the price differentials. Very enlightening reading for managers and consumers alike." Prof. Dr. Gilles Laurent, HEC Paris "Many asked me in the course of the year what is the essence of luxury, and there is in my opinion a one world answer to this: luxury is pure

emotion. In their book the authors provide an elaborated overview on luxury both from a researcher's and a manager's perspective. It's a must-read for those interested in luxury." Pietro Beccari, Chairman & CEO Fendi "As a maker of high-end mechanical watches, we are impressed by the precision of this analysis on the meaning of luxury today and the practical and

valuable conclusions for a successful management of luxury products. Most interesting work!" Philippe Merk, CEO Audemars Piguet "This book's development of luxury signals provides a new and creative perspective of luxury. Norton & Company* This book covers different, current research directions in the context of variational methods for non-linear geometric data. Each chapter is authored by leading experts in the

respective discipline and provides an introduction, an overview and a description of the current state of the art. Non-linear geometric data arises in various applications in science and engineering. Examples of nonlinear data spaces are diverse and include, for instance, nonlinear spaces of matrices, spaces of curves, shapes as well as manifolds of probability measures. Applications

can be found in biology, medicine, product engineering, geography and computer vision for instance. Variational methods on the other hand have evolved to being amongst the most powerful tools for applied mathematics. They involve techniques from various branches of mathematics such as statistics, modeling, optimization, numerical mathematics and analysis.

The vast majority of research on variational methods, however, is focused on data in linear spaces. Variational methods for non-linear data is currently an emerging research topic. As a result, and since such methods involve various branches of mathematics, there is a plethora of different, recent approaches dealing with different aspects of

variational methods for nonlinear geometric data. Research results are rather scattered and appear in journals of different mathematical communities. The main purpose of the book is to account for that by providing, for the first time, a comprehensive collection of different research directions and existing approaches in this context. It is organized in a way that

leading researchers from the different fields provide an introductory overview of recent research directions in their respective discipline. As such, the book is a unique reference work for both newcomers in the field of variational methods for non-linear geometric data, as well as for established experts that aim at to exploit new research directions or collaborations.

The spread of weapons of mass destruction poses one of the greatest threats to international peace and security in modern times—the specter of nuclear, chemical, and biological weapons looms over relations among many countries. The September 11

tragedy and other terrorist attacks have been painful warnings about gaps in nonproliferation policies and regimes, specifically with regard to nonstate actors. In this volume, experts in nonproliferation studies examine challenges faced by the international community and propose directions for national and international policy making and lawmaking. The first group of essays outlines the

primary threats posed by WMD proliferation and terrorism. Essays in the second section analyze existing treaties and other normative regimes, including the Nuclear Non-Proliferation Treaty and the Chemical Weapons and Biological Weapons Conventions, and recommend ways to address the challenges to their effectiveness. Essays in part three examine

the shift some states have made away from nonproliferation treaties and regimes toward more forceful and proactive policies of counterproliferation, such as the Proliferation Security Initiative, which coordinates efforts to search and seize suspect shipments of WMD-related materials.

Health Communication Theory University of Georgia Press This book provides fundamentally new insights into the seemingly elusive concept of luxury using examples from real life and precise cases. The outstanding feature is the development of the first numerical luxury index allowing managers to compare

various categories and signaling product opportunities. The concept of luxury signals leads to a large variety of additional marketing opportunities. Also, a new, precise and operational definition of luxury is developed. Providing empirical insights for Europe, America and Asia this book opens challenging perspectives to all those concerned with luxury. "The book Luxury:

University of Science & Technology (HKUST) [Oxford Case Histories in TIA and Stroke](#) Lexington Books This open access book describes methods for research on and research through design. It posits that ethnography is an appropriate method for design research because it constantly orients itself, like design projects, towards social realities. In research

processes, designers acquire project-specific knowledge, which happens mostly intuitively in practice. When this knowledge becomes the subject of reflection and explication, it strengthens the discipline of design and makes it more open to interdisciplinary dialogue. Through the use of the ethnographic method in design, this book shows how design researchers

can question the certainties of the everyday world, deconstruct reality into singular aesthetic and semantic phenomena, and reconfigure them into new contexts of signification. It shows that design ethnography is a process in which the epistemic and creative elements flow into one another in iterative loops. The goal of design ethnography is not to colonize the

discipline of design with a positivist and objectivist scientific ethos, but rather to reinforce and reflect upon the explorative and searching methods that are inherent to it. This innovative book is of interest to design researchers and professionals, including graphic artists, ethnographers, visual anthropologists and others involved with creative arts/media.

In addition, they are successfully being used to re-mineralise teeth, thereby making bioactive glasses highly attractive materials in both dentistry

Do you love monsters? I mean do you really love monsters? Monsters of all shapes, sizes, colors and creeds? If you do, then this is the anthology for you. Monsters and Other Shit is

the comic book monster anthology to end all monster anthologies. It's 224 pages of glorious monsters; funny monsters, scary monsters, sci-fi monsters, fantastical monsters, and everything in between. This isn't an ode to horror monsters, or sci-fi monsters, or any kind of monster specifically. It's a beautiful tribute to all kinds of monsters from Sesame Street to Aliens, and

much more. You'll get stories from 30 different creative teams who all love monsters as much as you love monsters. Creators who've worked in comic books for decades, and have loved monsters for even longer. Creators include: Russell Nohelty (Katrina Hates Dead Shit) Erik Lervold (The Red Calaveras) Katrina Kunstmann (Warhead, Zed) Juan

Rethinking Narrative Identity

CreateSpace Insects as a group occupy a middle ground in the biosphere between bacteria and viruses at one extreme, amphibians and mammals at the other. The size and general nature of insects present special problems to the study of entomology. For example, many commercially available instruments

are geared to measure in grams, while the forces commonly encountered in studying insects are in the milligram range.

Therefore, techniques developed in the study of insects or in those fields concerned with the control of insect pests are often unique. Methods for measuring things are common to all sciences. Advances some times depend more on how something

was done than on what was measured; indeed a given field often progresses from one technique to another as new methods are discovered, developed, and modified. Just as often, some of these techniques find their way into the classroom when the problems involved have been sufficiently ironed out to permit students to master the manipulations in a few laboratory

periods. Many specialized techniques are confined to one specific research laboratory. Although methods may be considered commonplace where they are used, in another context even the simplest procedures may save considerable time. It is the purpose of this series (1) to report new developments in methodology, (2) to reveal sources of groups who have dealt with and solved particular

entomological problems, and (3) to describe experiments which may be applicable for use in biology laboratory courses.
