In the last 30 years there have been dramatic changes in electrical technology--yet the length of the undergraduate curriculum has remained four years. Until some ten years ago, the analysis of transmission lines was a standard topic in the EE and CpE undergraduate curricula. Today most of the undergraduate curricula contain a rather brief study of the analysis of transmission lines in a one-semester junior-level course on electromagnetics. In some schools, this study of transmission lines is relegated to a senior technical elective or has disappeared from the curriculum altogether. This raises a serious problem in the preparation of EE and CpE undergraduates to be competent in the modern industrial world. For the reasons mentioned above, today's undergraduates lack the basic skills to design high-speed digital and high-frequency analog systems. It does little good to write sophisticated software if the hardware is unable to process the instructions. This problem will increase as the speeds and frequencies of these systems continue to increase seemingly without bound. This book is meant to repair that basic deficiency.

Analog and Digital Circuits for Electronic Control System Applications BRILL

This book presents the use of a microprocessor-based digital system in our daily life. Its bottom-up approach ensures that all the basic building blocks are covered before the development of a real-life system. The ultimate goal of the book is to equip students with all the fundamental building blocks as well as their integration, allowing them to implement the applications they have dreamed up with minimum effort.

In this fiercely ambitious study, Meredith Anne Hoy seeks to reestablish the very definitions of digital art and aesthetics in art history. She begins by problematizing the notion of digital aesthetics, tracing the nineteenth- and twentieth-century movements that sought to break art down into its constituent elements, which in many ways predicted and paved the way for our acceptance of digital art. Through a series of case studies, Hoy questions the separation between analog and digital art and finds that while there may be sensual and experiential differences, they fall within the same technological categories. She also discusses computational art, in which the sole act of creation is the building of a self-generating algorithm. The medium isn't the message - what really matters is the degree to which the viewer can sense a creative hand in the art.

Unlike books currently on the market, this book attempts to satisfy two goals: combine circuits and electronics into a single, unified treatment, and establish a strong connection with the contemporary world of digital systems. It will introduce a new way of looking not only at the treatment of circuits, but also at the treatment of introductory coursework in engineering in general. Using the concept of "abstraction," the book attempts to form a bridge between the world of physics and the world of large computer systems. In particular, it attempts to unify electrical engineering

and computer science as the art of creating and exploiting successive abstractions to manage the complexity of building useful electrical systems. Computer systems are simply one type of electrical systems. +Balances circuits theory with practical digital electronics applications. +Illustrates concepts with real devices. +Supports the popular circuits and electronics course on the MIT OpenCourse Ware from which professionals worldwide study this new approach. +Written by two educators well known for their innovative teaching and research and their collaboration with industry. +Focuses on contemporary MOS technology.

*Introduction to Communications Technologies* Petrogav International Film is often used to represent the natural landscape and, increasingly, to communicate environmentalist messages. Yet behind even today's "green" movies are ecologically unsustainable production, distribution, and consumption processes. Noting how seemingly immaterial moving images are supported by highly durable resource-dependent infrastructures, *The Cinematic Footprint* traces the history of how the "hydrocarbon imagination" has been central to the development of film as a medium. Nadia Bozak's innovative fusion of film studies and environmental studies makes provocative connections between the disappearance of material resources and the emergence of digital media—with examples ranging from

early cinema to Dziga Vertov's prescient eye, from Chris Marker's analog experiments to the digital work of Agnès Varda, James Benning, and Zacharias Kunuk. Combining an analysis of cinema technology with a sensitive consideration of film aesthetics, *The Cinematic Footprint* offers a new perspective on moving images and the natural resources that sustain them.
