Design for Manufacturability: How to Use Concurrent Engineering to Rapidly Develop Low-Cost, High-Quality Products for Lean Production shows how to use concurrent engineering teams to design products for all aspects of manufacturing with the lowest cost, the highest quality, and the quickest time to stable production. Extending the concepts of design for manufacturability to an advanced product development model, the book explains how to simultaneously make major improvements in all these product development goals, while enabling effective implementation of Lean Production and quality programs. Illustrating how to make the most of lessons learned from previous projects, the book proposes numerous improvements to current product development practices, education, and management. It outlines effective procedures to standardize parts and materials, save time and money with off-the-shelf parts, and implement a standardization program. It also spells out how to work with the purchasing department early on to select parts and materials that maximize quality and availability while minimizing part lead-times and ensuring desired functionality. Describes how to design families of products for Lean Production, build-to-order, and mass customization Emphasizes the importance of quantifying all product and overhead costs and then provides easy ways to quantify total cost Details dozens of design guidelines for product design, including assembly, fastening, test, repair, and maintenance Presents numerous design guidelines for designing parts for manufacturability Shows how to design in quality and reliability with many quality guidelines and sections on mistake-proofing (poka-yoke) Describing how to design parts for optimal manufacturability and compatibility with factory processes, the book provides a big picture perspective that emphasizes designing for the lowest total cost and time to stable production. After reading this book you will understand how to reduce total costs, ramp up quickly to volume production without delays or extra cost, and be able to scale up production rapidly so as not to limit growth.

This textbook provides a unified approach to acoustics and vibration suitable for use in advanced undergraduate and first-year graduate courses on vibration and fluids. The book includes thorough treatment of vibration of harmonic oscillators, coupled oscillators, isotropic elasticity, and waves in solids including the use of resonance techniques for determination of elastic moduli. Drawing on 35 years of experience teaching introductory graduate acoustics at the Naval Postgraduate School and Penn State, the author presents a hydrodynamic approach to the acoustics of sound in fluids that provides a uniform methodology for analysis of lumped-element systems and wave propagation that can incorporate attenuation mechanisms and complex media. This view provides a consistent and reliable approach that can be extended with confidence to more complex fluids and future applications. Understanding Acoustics opens with a mathematical introduction that includes graphing and statistical uncertainty, followed by five chapters on vibration and elastic waves that provide important results and highlight modern applications while introducing analytical techniques that are revisited in the study of waves in fluids covered in Part II. A unified approach to waves in fluids (i.e., liquids and gases) is based on a mastery of the hydrodynamic equations. Part III demonstrates extensions of this view to nonlinear acoustics. Engaging and practical, this book is a must-read for graduate students in acoustics and vibration as well as active researchers interested in a novel approach to the material.

Design for Manufacturing assists anyone not familiar with various manufacturing processes in better visualizing and understanding the relationship between part design and the ease or difficulty of producing the part. Decisions made during the early conceptual stages of design have a great effect on subsequent stages. In fact, quite often more than 70% of the manufacturing cost of a product is determined at this conceptual stage, yet manufacturing is not involved. Through this book, designers will gain insight that will allow them to assess the impact of their proposed design on manufacturing difficulty. The vast majority of components found in commercial batch-manufactured products, such as appliances, computers and office automation equipment are either injection molded, stamped, die cast, or (occasionally) forged. This book emphasizes these particular, most commonly implemented processes. In addition to chapters on these processes, the book touches upon material process selection, general guidelines for determining whether several

components should be combined into a single component or not, communications, the physical and mechanical properties of materials, tolerances, and inspection and quality control. In developing the DFM methods presented in this book, he has worked with over 30 firms specializing in injection molding, die-casting, forging and stamping. Implements a philosophy which allows for easier and more economic production of designs Educates designers about manufacturing Emphasizes the four major manufacturing processes

Operation Chastise, the audacious attack on the dams in the Ruhr valley, is arguably one of the most famous airborne attacks in history. During the night of 16/17 May 1943, 133 men in nineteen specially-adapted Lancasters – the famous Dambusters – set off to attack six dams deep in the heart of Germany. Eight of the bombers, and 56 of the aircrew, did not come home. Three of the aircrew who took part were from the High Peak region of Derbyshire. Flight Lieutenant Bill Astell, the pilot of ED864 who hailed from Coombs near Chapel-en-le-Frith, was killed after flying into electricity pylons on the way to the dams. The navigator in ED924, Sergeant John Nugent, from Stoney Middleton, survived the Dambusters Raid but was killed later in the war. The third High Peak Dambuster, on whom this biography concentrates, is the little-known Sergeant Jack Marriott from Chinley, the flight engineer on Lancaster ED937 during the attack. Marriott's Lancaster, Z-Zebra, reached the Möhne Dam, only to discover that it had been breached, some five bouncing bombs already having been released at it. The crew, led by Squadron Leader Henry Maudslay DFC, then flew on to the Eder Dam where their 'bouncing bomb' exploded beneath the Lancaster after hitting the parapet of the structure. The damaged Lancaster struggled homeward, but was shot down on the Dutch border; Jack, together with his crew, was killed in the crash. In this autobiography, Frank Pleszak explores Jack's life, his RAF service prior to joining 617 Squadron, and then the events leading up to and during Operation Chastise itself. But for Jack, one the immortal Dambusters, his story continued on after that historic night – particularly during the filming of the 1955 epic Dam Busters in which his aircraft features.

"Mother, you may have thought that you have had some great thrills in your life but let me tell you that you will never get a real thrill until you get up in the sky and have control of the plane making sharp turns, banks, glides and climbs." Harry L. Gill enlisted in the Royal Canadian Air Force in 1940 at the age of 18. He flew a Hurricane fighter on missions over France, England, and India and was awarded the Distinguished Flying Medal before being shot down near Burma in 1943. Hurricane Pilot recreates the heady days of flight and fellowship through Gill's own correspondence with his parents and siblings. Depicting the enthusiasm of youth, a sense of humour, his plans for the future, and an attachment to home, this very personal account of war shows how Gill was transformed from a small-town boy to a mature fighter pilot serving in a global war on another continent.
