Will didn’t plan to eat a stinkbug. But when his friend Darryl called new kid Eloy Herrera a racial slur, Will did it as a diversion. Now Will is Bug Boy, and everyone is cracking up inventing insect meals for him, like French flies and maggot-aroni and fleas. Turns out eating bugs for food is a real thing, called entomophagy. Deciding that means he can use a class project to feed everyone grasshoppers, Will bargains for Eloy’s help in exchange for helping him with wrestling, but their growing friendship only ticks off Darryl more. Will may have bitten off more than he can chew as crickets, earthworm jerky—even a scorpion—end up on his plate, but insects are the least of his problems. When things with Darryl and Eloy heat up, Will wrestles with questions of loyalty, honor—and that maybe not all friendships are worth fighting for.

Rich tasks, collaborative work, number talks, problem-based learning, direct instruction...with so many possible approaches, how do we know which ones work the best? In *Visible Learning for Mathematics*, six acclaimed educators assert it’s not about which one—it’s about when—and show you how to design high-impact instruction so all students demonstrate more than a year’s worth of mathematics learning for a year spent in school. That’s a high bar, but with the amazing K-12 framework here, you choose the right approach at the right time, depending upon where learners are within three phases of learning: surface, deep, and transfer. This results in “visible” learning because the effect is tangible. The framework is forged out of current research in mathematics combined with John Hattie’s synthesis of more than 15 years of education research involving 300 million students. Chapter by chapter, and equipped with video clips, planning tools, rubrics, and templates, you get the inside track on which instructional strategies to use at each phase of the learning cycle: Surface learning phase: When—through carefully constructed experiences—students explore new concepts and make connections to procedural skills and vocabulary that give shape to developing conceptual understandings. Deep learning phase: When—through the solving of rich high-cognitive tasks and rigorous discussion—students make connections among conceptual ideas, form mathematical generalizations, and apply and practice procedural skills with fluency. Transfer phase: When students can independently think through more complex mathematics, and can plan, investigate, and elaborate as they apply what they know to new mathematical situations. To equip students for higher-level mathematics learning, we have to be clear about where students are, where they need to go, and what it looks like when they get there. *Visible Learning for Math* brings about powerful, precision teaching for K-12 through intentionally designed guided, collaborative, and independent learning.
